Fitting the appliance into framing

1. Fold out four mounting tabs and install the appliance in the framing as shown.
2. Fasten the unit to framing using 4 screws or nails at the mounting tabs.

Note: The sheet metal strip at the bottom of the appliance must be flush with the framing studs.

Minimum Cement Board Dimensions

Minimum coverage area of non-combustible cement board. Any wall finish applied to shaded area must be non-combustible.
Wall Finishing

Non-combustible cement board
The L2 Linear fireplace requires a 1/2" (13 mm) thick non-combustible cement board to be used as a wall surface immediately surrounding the unit on each side—see diagram below for minimum coverage.

Extending the cement board well beyond the minimum shown will help avoid cracking due to differential expansion of materials.

Pre-drill cement board with oversized holes and do not over-tighten screws to avoid cracking due to heat expansion.

Standard gypsum wall board may be used beyond the perimeter of the cement board.

Non-combustible finishing over cement board
Additional non-combustible material such as tile, etc., may be applied over top of the cement board or you may choose to leave it finished clean with no tile—see page 38. Be aware that a trim is always required and that only the 1755 and 1750 style trims will accept tile, etc. tucked behind them (up to 5/8" thick for the 1755 and up to 1 inch thick for the 1750). Finish should not cover the trims.

Cracking wall finishes
We recommend installing the optional LDK Duct Kit to reduce the wall temperatures and minimize the possibility of cracking wall finishes.

If a clean finish with no tile, etc. is desired, joints in the cement board and the transition to gypsum board will require special attention if future cracking is to be controlled. Be aware that temperatures on the non-combustible wall surface above the appliance can exceed 250°F.

Below are some tips on how to best avoid any cracking:

- Always pre-drill screw holes through cement board and use screws with self-milling head.
- Always use tape over joints.
- Behind joints, double up studs or use studs “on the flat” to add extra support to the joint. Adhesive on the backside of wall board behind any joints can help control differential movement.
- Use multiple, thinner coats of joint compound and allow to dry thoroughly between coats.
- Ensure framing materials are dry.
- After finishing the wall, introduce heat gradually to slowly dry any excess moisture rather than drying too fast.
- Avoid notching cement board or tiles around corners of window opening and instead provide a joint that intersects the corner. Avoid notching cement board or tiles around corners of window opening and instead provide a joint that intersects the corner.
- Board flush with bottom of heater; add extra if overlapping framing.
- Joints preferred at corners to prevent cracking.
1700J L2 Linear Direct Vent ZC
Cement Board & Wall Finishing

1750 5-1/4” Steel Trim
Wider trim, can adjust up to 1” forward of surface of cement board

1755 1” Steel Trim
Narrow trim, can adjust up to 5/8” forward of surface of cement board
